

State-of-the-Art: Cut Energy Costs through Alternative Fuels.

Saving energy costs is a top priority for every company.

To reach this goal, one approach is to use alternative fuels for kilns and boilers such as shredded plastic and production waste, old tyres and grinding dusts, meat-and-bone meal and shredded domestic waste.

The Schenck Process compact system for alternative fuels is not only cost-effective, but also flexible. Even when used with a great variety of materials it requires neither structural changes nor reserve silos.

The Schenck Process compact system for alternative fuels: getting the job done with a low level of investment.
